Get online Kundli charting and forecasting software for the Kundali in Indian languages of Hindi, Marathi, Tamil, Telugu and Bengali. The software can be used to make an independent Kundali, other wise known as a Panchkundali. I am currently using Google App Engine as my backend server, and would like to do a cross-platform (Android, iOS) "remoting" of requests. I don't need to access any user data, I just want to send information between android and app engine (and vice-versa). I've found this link which states that I could use RESTful Webservice and I am trying to follow these instructions in order to do so. It doesn't have any real good documentation for the new App Engine version, so I am trying to do some test with a RESTful API app. I've created a project and a "service" project. The problem is, I cannot figure out how to add the GET/POST params to my appengine backend code. I have tried to

---

change the way my backend is declared (putting it into a class with a main function) but I get "com.google.appengine.tools.development.gwt.AppEngineLauncher\$AppEngineStartupException: Unable to find an 'App Engine application' defined in the service configuration file." The appengine backend doesn't seem to recognize the "createUrl" call. Am I doing something wrong or do I need some other steps? A: Check out the docs for Running web services in the App Engine SDK 82157476af
